

I believe that this is a good step for amateur radio to extend the voice segment of the bands. If one were to listen to the usage of the bands, the voice segments are typically much more densely used than the CW portions. The only exception to this is contests, where no matter which section of the band you are in, it is packed.

For general, non contest use, this change would allow much more efficient use of the bands that are already allocated without requiring more spectrum.
